# Driving automation systems

## Levels of automation (JSAE 3016)

Level	Name	Narrative definition	DDT		DDT fallback	ODD
			Sustained lateral and longitudinal vehicle motion control	OEDR		
<b>Driver performs part or all of the DDT</b>						
0	No Driving Automation	The performance by the <i>driver</i> of the entire DDT, even when enhanced by <i>active safety systems</i> .	<i>Driver</i>	<i>Driver</i>	<i>Driver</i>	n/a
1	Driver Assistance	The <i>sustained</i> and ODD-specific execution by a <i>driving automation system</i> of either the <i>lateral</i> or the <i>longitudinal vehicle motion control</i> subtask of the DDT (but not both simultaneously) with the expectation that the <i>driver</i> performs the remainder of the DDT.	<i>Driver and System</i>	<i>Driver</i>	<i>Driver</i>	Limited
2	Partial Driving Automation	The <i>sustained</i> and ODD-specific execution by a <i>driving automation system</i> of both the <i>lateral</i> and <i>longitudinal vehicle motion control</i> subtasks of the DDT with the expectation that the <i>driver</i> completes the OEDR subtask and <i>supervises</i> the <i>driving automation system</i> .	<b>System</b>	<i>Driver</i>	<i>Driver</i>	Limited
<b>ADS ("System") performs the entire DDT (while engaged)</b>						
3	Conditional Driving Automation	The <i>sustained</i> and ODD-specific performance by an ADS of the entire DDT with the expectation that the DDT fallback-ready user is <i>receptive to ADS-issued requests to intervene</i> , as well as to DDT performance-relevant system failures in other vehicle systems, and will respond appropriately.	<i>System</i>	<b>System</b>	<i>Fallback-ready user (becomes the driver during fallback)</i>	Limited
4	High Driving Automation	The <i>sustained</i> and ODD-specific performance by an ADS of the entire DDT and DDT fallback without any expectation that a user will respond to a <i>request to intervene</i> .	<i>System</i>	<i>System</i>	<b>System</b>	Limited
5	Full Driving Automation	The <i>sustained</i> and unconditional (i.e., not ODD-specific) performance by an ADS of the entire DDT and DDT fallback without any expectation that a user will respond to a <i>request to intervene</i> .	<i>System</i>	<i>System</i>	<i>System</i>	<b>Unlimited</b>

# The loop – a simplistic view

# What do we actually mean by being in the loop?

- ❑ What is “the loop”?
- ❑ What does it mean to be in it?
- ❑ What does it mean to be out of it?
- ❑ Can we speak of different loops related to different levels of the driving task (e.g., operational, tactical, strategic)?
- ❑ Does being in the loop require active processing (e.g., steering, braking)?
- ❑ Does being in the loop require controlled (conscious, effortful) processing or is automatized (skilled, unconscious, effortless) performance sufficient?
- ❑ Should being in the loop be viewed as an all-or-none phenomenon or as a continuum?

# Predictive Processing

## Neuroscience

Karl Friston, The free energy formulation

Friston, K. J. 2010 The Free-energy Principle: A Unified Brain Theory? *Nature Reviews Neuroscience* 11(2):127–38.

## Cognitive science

Andy Clark, predictive processing

Clark, A. 2016. *Surfing uncertainty*. Oxford: Oxford University Press.

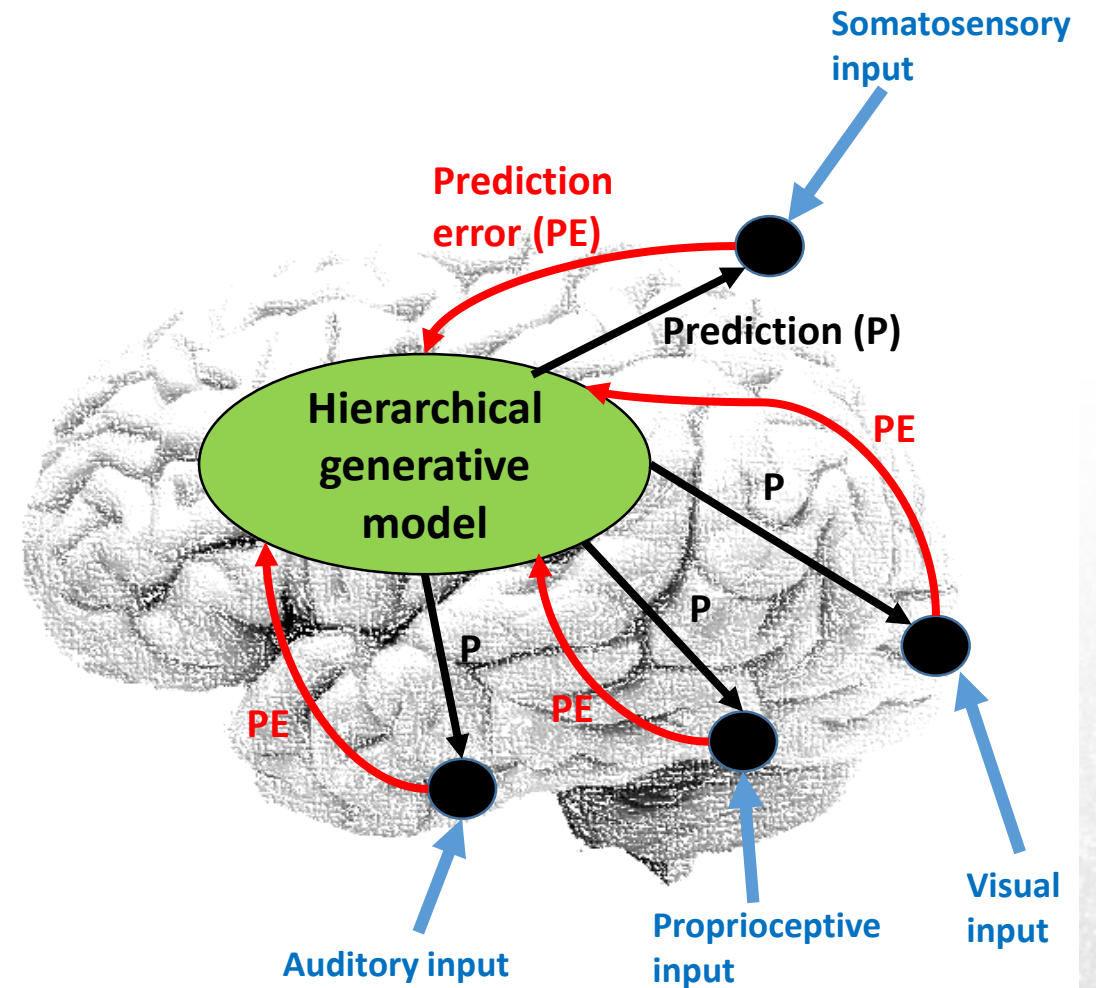

## Applied human factors

Engström, J., Bårgman, J., Nilsson, D., Bianchi Piccinini, G.F., Seppelt, B., Markkula, G., Victor, T. (2017). Great expectations: A predictive processing account for automobile driving. *Theoretical Issues in Ergonomics Science*, in press.

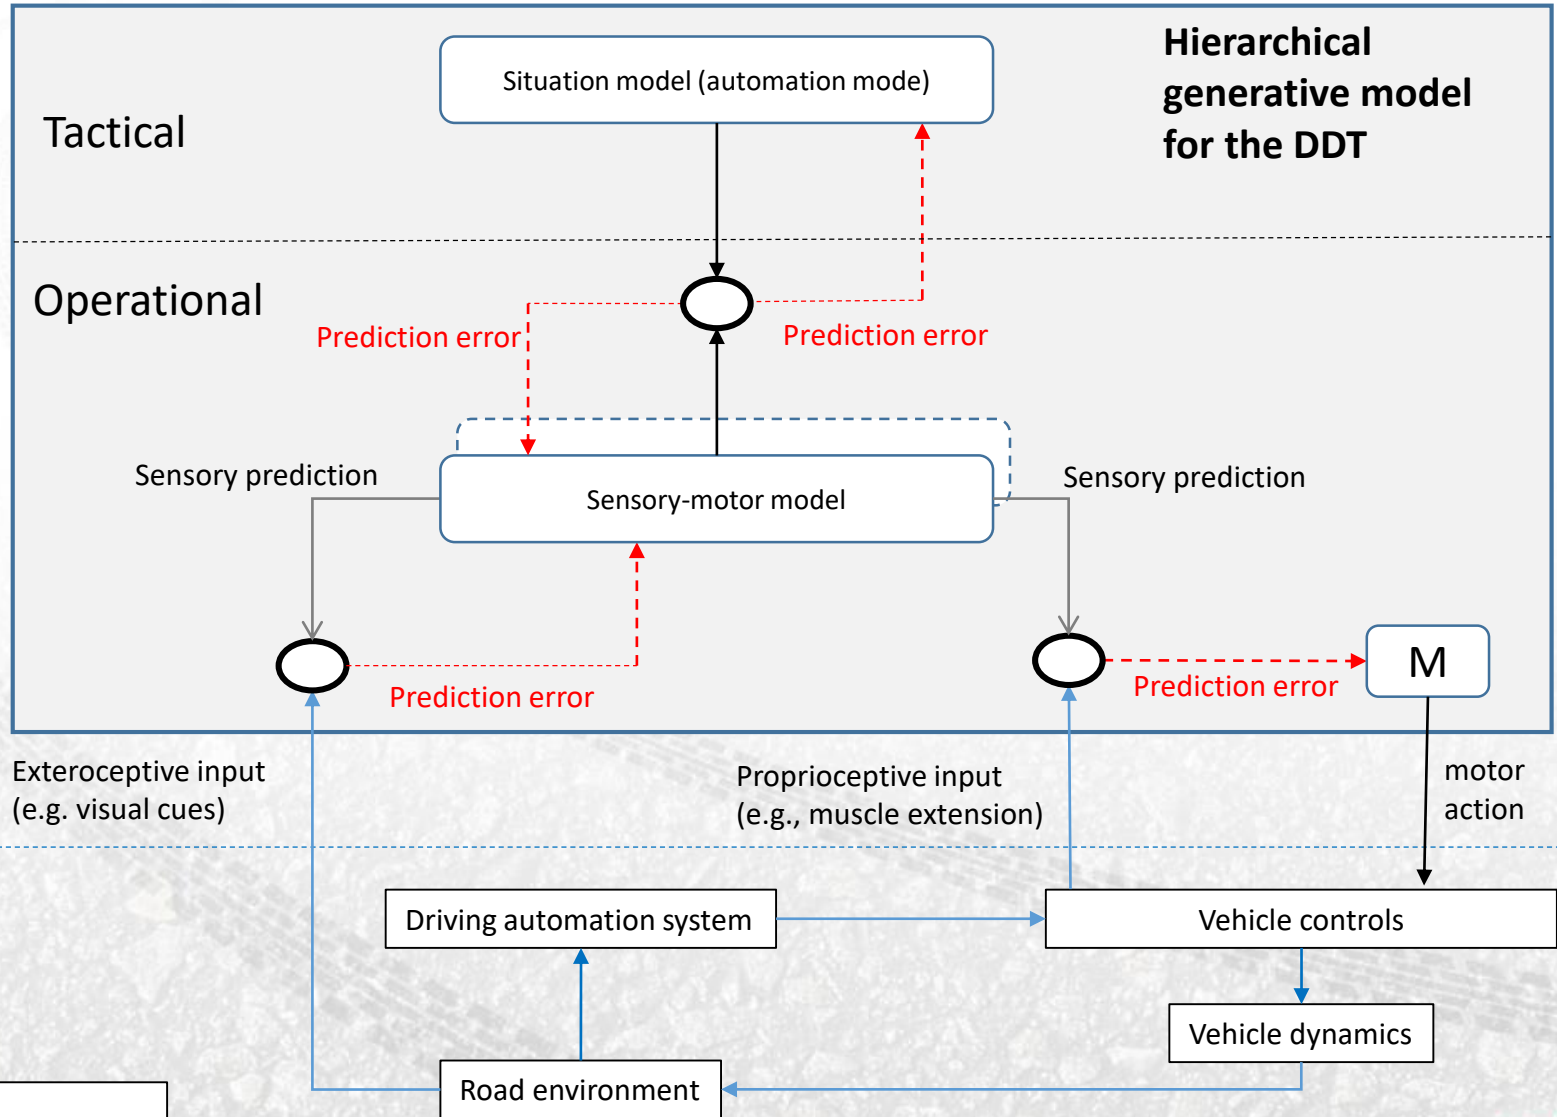

# Predictive processing

- ❑ **Unifying principle:** All cognition and behavior can be understood in terms of *predictions and the minimization of prediction errors*
- ❑ Predictions are continuously generated in all sensory modalities by a **hierarchical generative model** (a special kind of “mental model”)
- ❑ Sensory prediction errors can be minimized by:
  - Updating the prediction (perception)
  - Aligning the sensory input with the prediction (action)
- ❑ Minimizing prediction errors by perception and action = (active) inference

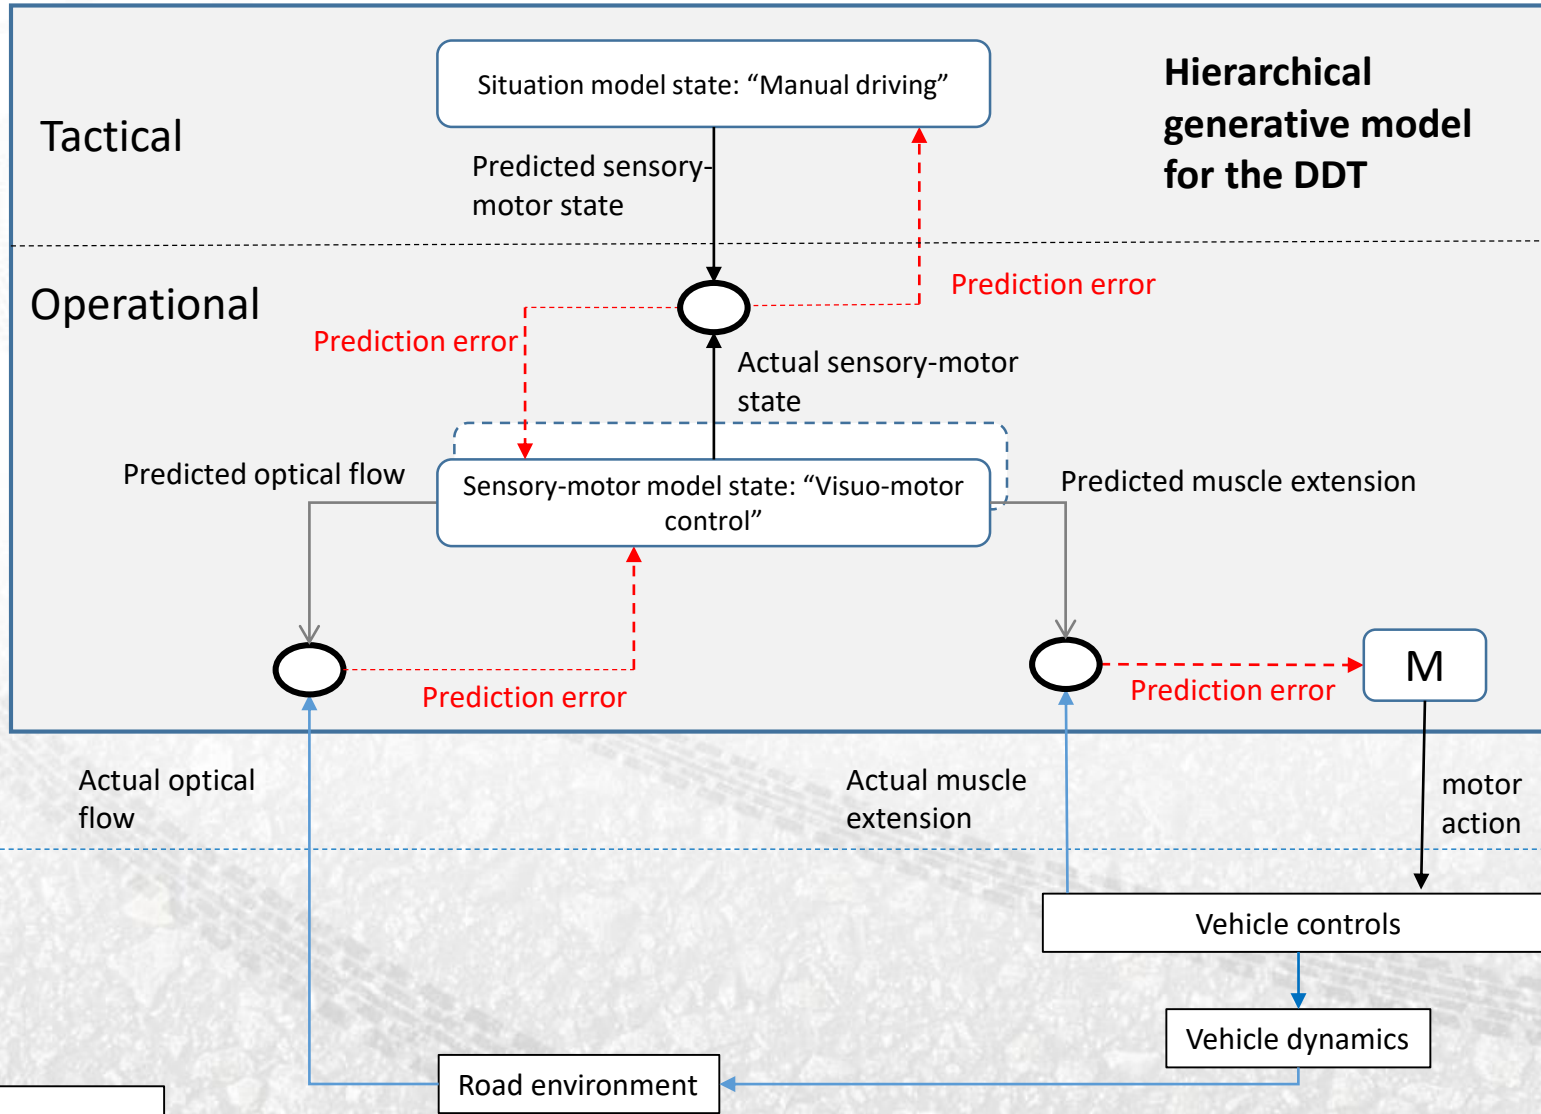

# Application to automated driving

# Example: Manual driving

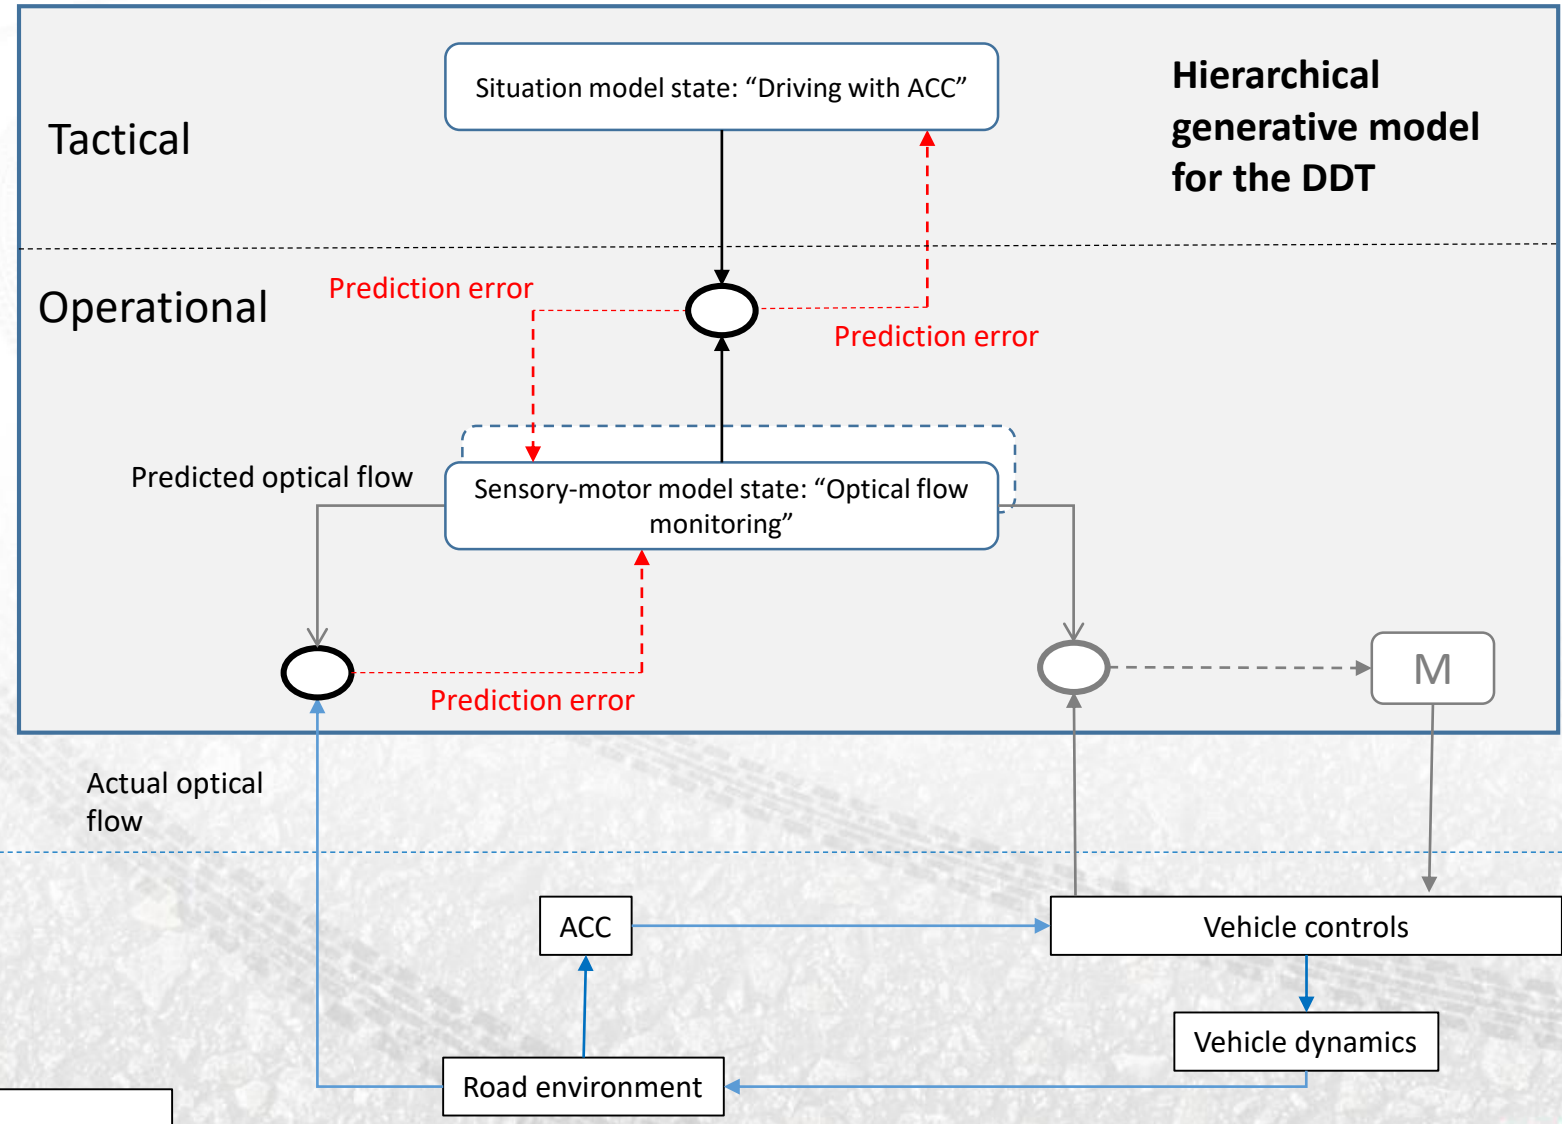

Actively aligning the actual with predicted optical flow by braking and accelerating

# Example: Driving with Adaptive Cruise Control (L1 automation)

Passively monitoring that the actual optical flow is aligned with the predicted

# So, what do we mean by being in the loop? (1)

- ❑ What is “the loop”?
  - The process of inference = generating predictions and cancelling prediction errors by perception and/or action
- ❑ What does it mean to be in it?
  - Being in the loop for driving subtask X = Being engaged in inference (generating predictions and cancelling prediction errors) related to X
- ❑ What does it mean to be out of it?
  - Being out of the loop for driving subtask X = No predictions are generated relative to subtask X
- ❑ Can we speak of different loops related to different levels of the driving task (e.g., operational, tactical, strategic)?
  - Yes, inference at the operational level relates to predictions about sensory input. Inference at higher levels (tactical, strategic) relates to predictions about the *state* of the level below
  - One can thus be in the loop at the tactical level but out of the loop at the operational level

## So, what do we mean by being in the loop? (2)

- ❑ Does being in the loop require active processing (e.g., steering, braking)?
  - No, since passive monitoring also involves generating predictions and cancelling prediction errors (but here only by perception=updating the model state generating the prediction)
  - The active-passive processing distinction is important but does not define OOTL
- ❑ Does being in the loop require controlled (conscious, effortful) processing or is automatized (skilled, unconscious, effortless) performance sufficient?
  - The latter. Inference take place in both controlled (novel tasks) and automatized (after practice) performance "modes"
- ❑ Should being in the loop be viewed as an all-or-none phenomenon or as a continuum?
  - As a continuum

# Example: Level 1-2 automation

- ❑ *Critical distinction:* Is the driver is in the loop for the OEDR task at the operational level or only at the tactical level?
- ❑ According to PP, depends on whether the driver generates predictions at the operational level

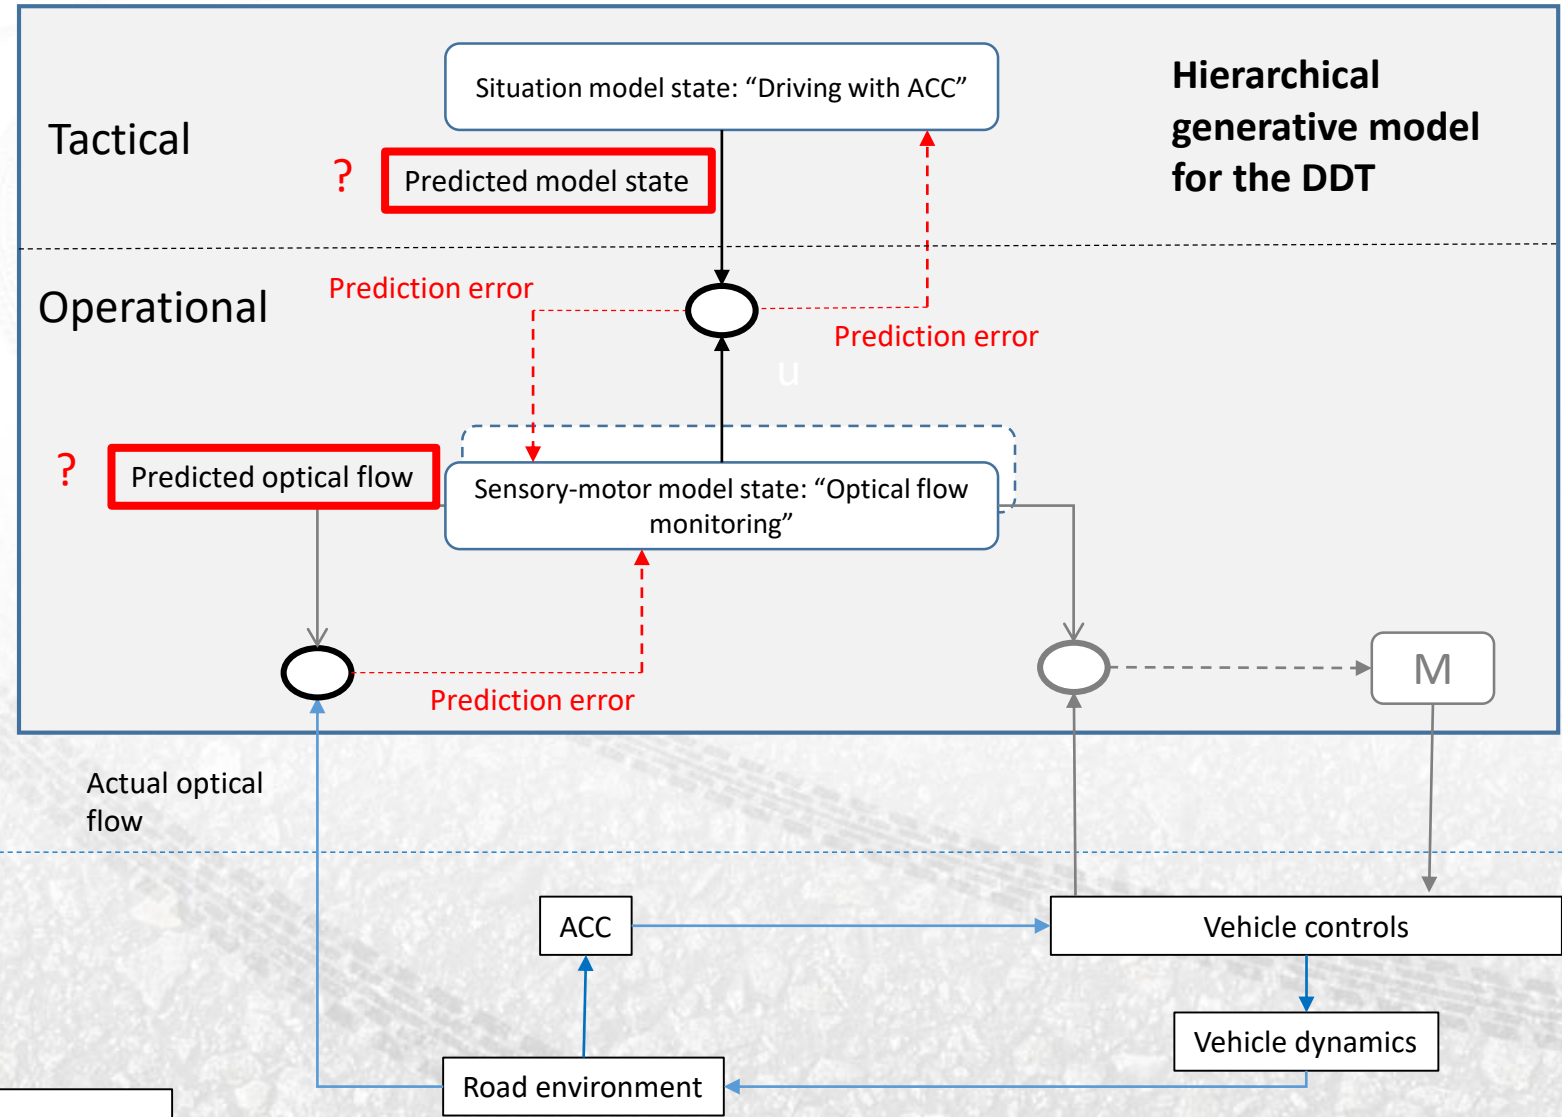

## SAE J3016

Level	Name	Narrative definition	DDT		DDT fallback	ODD
			Sustained lateral and longitudinal vehicle motion control	OEDR		
<i>Driver performs part or all of the DDT</i>						
0	No Driving Automation	The performance by the <i>driver</i> of the entire DDT, even when enhanced by <i>active safety systems</i> .	Driver	Driver	Driver	n/a
1	Driver Assistance	The <i>sustained</i> and <i>ODD-specific</i> execution by a <i>driving automation system</i> of either the <i>lateral</i> or the <i>longitudinal vehicle motion control</i> subtask of the DDT (but not both simultaneously) with the expectation that the <i>driver</i> performs the remainder of the DDT.	Driver and System	Driver	Driver	Limited
2	Partial Driving Automation	The <i>sustained</i> and <i>ODD-specific</i> execution by a <i>driving automation system</i> of both the <i>lateral</i> and <i>longitudinal vehicle motion control</i> subtasks of the DDT with the expectation that the <i>driver</i> completes the OEDR subtask and <i>supervises</i> the <i>driving automation system</i> .	System	Driver	Driver	Limited

# Example: Driving with Adaptive Cruise Control (L1 automation)

Passively monitoring that the actual optical flow is aligned with the predicted

# Conclusions

- ❑ Being in or out-of-the-loop concept is a key concept in understanding driving performance related to automated driving
- ❑ However, lacks a precise mechanistic definition
- ❑ Proposed such a definition based on the predictive processing framework originating in neuroscience and cognitive science
- ❑ Next question: Can the predictive processing help us to better understand why drivers get out of the loop (e.g., due issues with complacency, sustained attention and fatigue)?
- ❑ Conceptual and computational models based on these ideas are currently underway

# How do drivers get out of the loop?

Two distinct mechanisms

## 1. Vigilance and complacency problems

- PP: Information sources not contributing to overall minimization of prediction error will not be monitored
- Related to lack of stimulation/information, passive fatigue, cognitive bias
- **Selection problem**

## 2. Reduced arousal

- PP: Reduced activation level in the generative model
- Related to sleep-related factors (circadian and homeostatic) and task-related factors (e.g., time on task)
- Can be modelled in terms of the rate of evidence accumulation (see Markkula and Engstrom, 2017; presented tomorrow at 10.30)
- **Activation problem**
