## **Analysis of Driver Behavioral Adaptation to the Lateral Drift Warning System** Adam Greenstein, PE, Penn State University 3) Aggregate Analysis

## 1) Introduction/Objectives

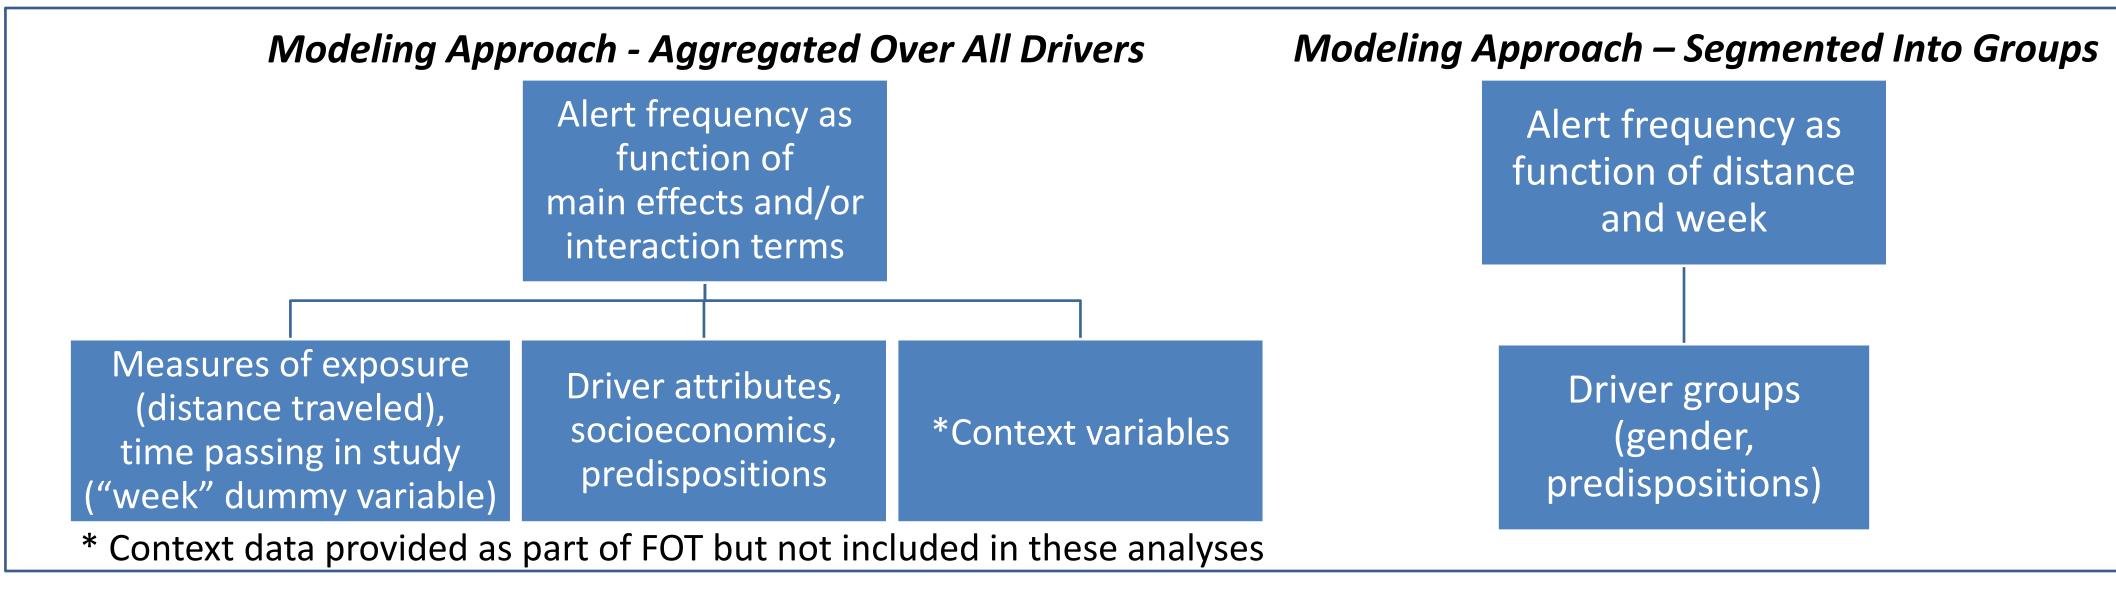

- Behavioral adaptation changes in driving behavior over time as drivers adjust to presence of technologies
- Adaptation relies on human predisposition. Drivers perceive risk differently depending on personality.
- Assessing adaptation while using ITS safety devices important role in determining benefit from device implementation

# 2) Data and Methodology

- Univ. of MI Transportation Research Institute (UMTRI) Roadway Departure Crash Warning Field Operational Test
- Lateral drift warnings: visual, audible, tactile vehicle exceeded thresholds of lateral distance from lane centerlines
- 71 drivers from Ann Arbor, MI, area each participated for 4 weeks
- Week 1: pseudo-alerts system recorded alert instances but did not warn driver
- UMTRI Technical Report (*Ref. 1*) shows changes in driving behavior over time lateral vehicle positioning

• Model Type – Random Effects Negative Binomial (RENB), grouped by driver

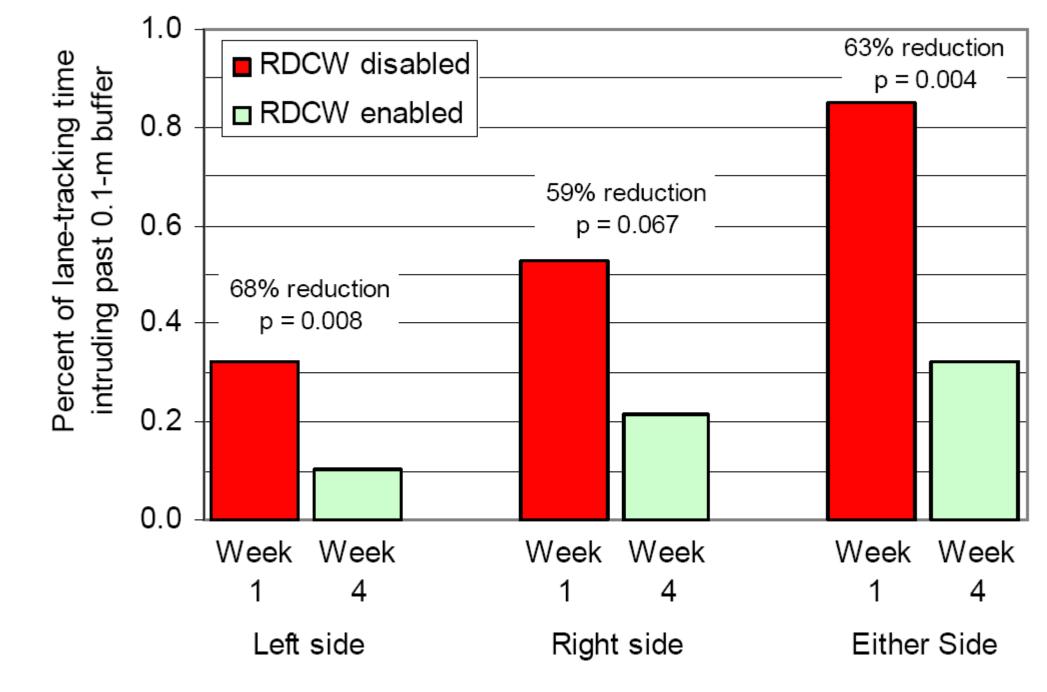

<b>Descriptive Statistics and Categorization of</b>			Segmentation of Predispositions			
Driver AttributesFactorMeanCategories		Categories	Variable	Definition	<i>Response Type (# of questions)</i>	Segmentation – Mean
Gender (binary; 1 = male)	0.49	Male, Female	Sensation-Seeking Desires	Need for excitement	Binary (40)	High, Low; score = 14
Smoker (binary; 1=yes) Years with driver's license (min. = 2.5, max = 54)	0.83 28.19	Yes, No 0-21; 22-37; 38+	Risk Perception	Risk associated with driving	7-pt Likert Scale (30)	High, Low; score = 84.79
			Locus of Control	What controls outcomes in life	Binary (13)	Internal, External; score = 3.82

<b>RENB – All Drivers</b>						
Variable	Coef.	е <sup>соеf.</sup>				
Weekly distance (miles)	0.003	1.003				
Week 2	-0.270	0.763				
Week 3	-0.356	0.700				
Week 4	-0.387	0.679				
Constant	0.696	2.006				

• Alert freq. decreased with each passing week, offset by travel dist. • Relationship between exposure and alert freq. - not linear • Interactions: gender, smoker, yrs. with license - inconclusive

### 5) Conclusions

• Drivers in study decreased alert frequency over time. Various characteristics can influence adaptation. • Exposure significantly positively correlates with alert likelihood

• Small sample size - limits of reasonability for parameter significance and number of parameters evaluated • Effects of some predictors may be influenced by technological skill levels (not measured) – biased estimates

--Low SS, week 4
